

Best basement waterproofing

The appearance of water in a basement or ground floor room is a major problem for home owner, commercial operator or builder. Good waterproofing (tanking) is relatively easy to achieve with the correct commitment.

Requirements for effective long term waterproofing

- A well prepared site with clear and clean footing which drains away from structure
- Footing is well below floor level
- Drainage coil below (not on) footing
- Drainage coil sitting on site concrete, or clean fill (not earth or clay)
- Drainage coil rises to a accessible high point to allow flushing of fine sediments into a sump
- The Bituthene 3000 is lined with drainage sheet and protection layer
- Backfilling is carefully selected and installed (not site waste)
- Bituthene upper termination / flashing is correctly installed
